

Shared Clarity.

TACEDGE builds field coordination software for hard ground and hard places. We are field people who built software, not the reverse.

01 Where we come from

Our backgrounds are military and aviation. Mike planned the Whakaari response; Dan flew the helicopters. From opposite ends of the same operation we hit the same problem: capable people, good systems, and no shared picture of the work as it happened. TACEDGE exists to close that gap.

02 What we have built

TACEDGE Ground Engineering runs the delivery workflow for anchoring and drilling. It is **in production with crews in New Zealand and Samoa today**: work configured before the crew mobilises, captured once at the point of work, confirmed as engineering evidence worth signing against. Our ambition is a world-class ground engineering delivery product built on one operational habit: the field is the source of truth.

Configure · Capture · Confirm

03 What we would like to explore with Fulton Hogan

Under the Integrated Delivery Model a network is delivered by many parties: Fulton Hogan, NZTA, MSQA providers, directory suppliers. The systems you run are excellent at single-party answers. The strain is the shared, multi-party picture, on networks where roughly 40 percent of the country has no cellular coverage and the picture matters most exactly when weather takes the towers down.

We want to explore a **thin coordination layer above the systems you already run**, replacing none of them, satellite-enabled through One NZ so it keeps working when terrestrial networks do not. We are not here to pitch a product. We would rather understand how coordination actually strains on your networks, and test whether this is worth building with you.

THE QUESTIONS WE ARE BRINGING

- 01 Where does multi-party coordination strain hardest under IDM mobilisation? What does a bad day look like operationally?
- 02 In the last significant storm response, how was the operational picture actually assembled?
- 03 How does NZTA get visibility of network status and response progress during an event today?
- 04 Where does connectivity bite hardest, and on which network would satellite change the answer?

THE RIGHT NEXT STEP

One network, validated together

If this is worth pursuing, the next step is small and real: pick one network and prove the shared picture is worth having. Integration with your systems comes only after the picture earns it.

Prepared for discussion. Not a proposal, and no commitment is implied on either side.
